Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dual Supply Voltage Level Translator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A dual-power level converter IC is an integrated circuit that can achieve bidirectional signal level conversion between different voltage domains. Its core feature is that it supports two independent power supply voltages (VCCA and VCCB), allowing flexible configuration in the range of 0.8V to 3.6V, solving the communication compatibility problem between low-voltage systems (such as 1.8V, 3.3V) and high-voltage devices (such as 5V). This type of device uses built-in MOSFET switches or automatic direction detection circuits to achieve bidirectional data transmission between two voltage domains (without manual direction control), and has the characteristics of overvoltage protection, low power consumption, and high dynamic output current capability. Typical applications include automotive electronics (such as CAN bus, sensor interface), industrial control, consumer devices (such as I²C, SPI communication) and Internet of Things scenarios, and are widely used in complex systems that require multiple voltage domains to work together.

The global Dual Supply Voltage Level Translator market size was estimated at USD 451.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
