Report Overview

Duchenne muscular dystrophy, sometimes shortened to DMD or just Duchenne, is a rare genetic disease. It predominantly affects males, but, in rare cases, can also affect females. Duchenne causes the muscles in the body to become weak and damaged over time and is eventually fatal. The genetic change that causes Duchenne—a mutation in the DMD gene—happens before birth and can be inherited, or new mutations in the gene can occur spontaneously. Muscle weakness becomes increasingly noticeable between the ages of 3 and 5, and most patients use a wheelchair by the time they are 12. During adolescence, heart and breathing muscles weaken, leading to serious, life-threatening complications.

The global Duchenne Muscular Dystrophy Therapeutics market size was estimated at USD 1329.20 million in 2023 and is projected to reach USD 7445.39 million by 2032, exhibiting a CAGR of 21.10% during the forecast period.
