Abstracts

Dural repair refers to the medical procedures and techniques used to repair the dura mater, which is the outermost layer of the three membranes (meninges) covering the brain and spinal cord. The dura mater serves as a protective barrier for the central nervous system. When it is damaged, either through trauma, surgery, or other causes, dural repair becomes necessary to restore the integrity of the meninges and prevent complications such as cerebrospinal fluid (CSF) leaks. The gross margin of dural repair was about 26%. Market Concentration and Key Players: Internationally, the market concentration of dura mater repair is relatively high, mainly concentrated in developed countries such as Europe and America. For example, large manufacturers such as Integral LifeSciences and DuraStat; from the domestic perspective, there is still much room for development of dural repair. Manufacturing Processes and Market Trends: The manufacturing process of dural repair products mainly revolves around the creation of biomaterials that can effectively seal and promote tissue regeneration, and the traditional process is dominated by the processing of decellularization of animal tissues and synthetic materials. For example, heterogeneous biomaterials such as bovine pericardium or porcine small intestinal submucosa need to undergo complex physical and chemical treatments to remove cellular components and reduce immunogenicity, while synthetic materials often use polymers such as polycaprolactone to construct biomimetic nanofiber scaffolds through electrospinning technology. Current technological innovations favor the development of multifunctional composites, such as Harvard's slug-inspired "Dural Tough Adhesive," which combines high elasticity with strong adhesion to achieve an effective seal on moist tissue surfaces. At the same time, smart materials such as new light-responsive pullulan-based adhesives are also being explored, which pursue rapid curing and have therapeutic functions such as anti-fibrosis. In terms of market trends, the field of dural repair is developing steadily with the increase of neurosurgical procedures, especially in the context of aging population, and

the demand for craniocerebral surgery continues to grow. The remarkable feature of China's market is that the in-depth implementation of the national centralized procurement policy leads to a significant decline in the terminal price of products, but the huge demand hedges the price pressure to a certain extent and promotes the gradual recovery of market scale after adjustment. The market competition pattern is highly concentrated. Domestic products have achieved a leading position by virtue of cost advantage and continuous innovation. The localization rate is as high as about 90%. Major manufacturers such as Guanhao Bio-tech and Zhenghai Bio-tech occupy an important share. The future development direction focuses on further innovation of material technology, including personalized customization through 3D printing, development of bioactive composite materials and improvement of biocompatibility and functionality of materials, which are expected to better meet the dual needs of clinical repair effect and safety.

The global Dural Repair market size was estimated at USD 368.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
