Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dust and Fume Extraction System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Dust and Fume Extraction System reached approximately 24,916 k ?, with an average global market price of around 139.0 USD/?. Gross margin is about 24.49%. The cost is 104.96 usd. Production Capacity is about 26,000-27,000 k ?. Dust and Fume Extraction System is a specialized industrial filtration system designed to capture and remove airborne particulates, fumes, and dust generated in environments where processes involve high temperatures, typically exceeding 220°C (428°F). These systems are essential in industries such as metalworking, cement production, power generation, and chemical processing, where conventional dust collectors would fail due to heat-induced damage. The upstream sector primarily includes manufacturers of high-temperature resistant filter materials, ceramic/metal processing companies, suppliers of refractory insulation materials, manufacturers of high-temperature fans and valves, and manufacturers of emission source equipment such as boilers and smelting furnaces. The downstream sector covers industries requiring flue gas purification at temperatures ranging from hundreds to thousands of degrees Celsius, including steel, metallurgy, cement, glass, waste incineration, chemicals, and energy, as well as environmental engineering companies undertaking equipment integration, operation and maintenance services, and emission compliance management. The entire industry chain revolves around improving the performance of high-temperature filter materials, system sealing, corrosion resistance, and continuous stable operation. The application and development of dust removal technology is closely related to the process of industrialization. Dust removal technology generally includes mechanical dust removal, wet dust removal, electrostatic dust

removal and bag dust removal. Mechanical dust removal uses the gravity sedimentation, inertia or centrifugal force of dust to separate dust. Its dust removal efficiency is generally below 90%, with low dust removal efficiency, low resistance and energy saving; wet dust removal uses the gas-liquid contact washing principle to separate dust from dust-containing gas into liquid to remove dust from the gas. Its dust removal efficiency is slightly higher than that of mechanical dust removal, but it is easy to cause secondary pollution of the washing liquid. Electrostatic dust collectors were used earlier in China. In the past, due to the poor filter material manufacturing process and the damage of filter bags, the dust removal efficiency was low and the bag replacement was frequent, resulting in the failure of bag dust collectors to be promoted and applied. In recent years, with the development of filter cloth material manufacturing technology, the strength, high temperature resistance, corrosion resistance and wear resistance of filter cloth have been greatly improved.

The global Dust and Fume Extraction System market size was estimated at USD 3463.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
