Report Overview

Dust Control Agents, also known as dust suppressing chemicals, are specialty fluids that are sprayed on the surface like roads or stockpiles to stop generation of dust. Dust control agents include various salts and polymeric emulsions. Dust control agents help in achieving many things, which boosts its demand. The ongoing demand for controlling dust in various setups such as mines, quarries, construction sites, roads, demolition sites, and stockpiles increase demand for dust control agents. Most of these products are odorless and biodegradable. It can be diluted with water before application or can be used as a standalone fluid. Dust control agents form a protective layer even at low temperatures, as well as having good adhesion to dust particles. Dust control agents help in binding coal dust particles in a coal mine, which otherwise is responsible for lung diseases. Dust suppressants are sprayed on roadways to prevent clouds of dust during high vehicle traffic, thereby maintaining road visibility and reducing air pollution. There are other end-use industries where dust mitigation is important, which include use of dust control agents on airport roads, power industry, steel, and military. However, lack of product awareness among various end-uses could limit adoption of dust control products during the forecast period. Moreover, water as a standalone dust suppressant is still used in various applications.
