Abstracts

Dyes for protein fibers represent a specialized class of colorants designed to chemically bond with natural protein-based materials such as wool, silk, cashmere, mohair, and other animal-derived textiles, which possess amino acid functional groups that enable substantive dye uptake through ionic, hydrogen bonding, or covalent interactions. These dyes are categorized into several types, including acid dyes, which are the most widely used due to their affinity for protein fibers under acidic conditions; reactive dyes, which form strong covalent bonds for excellent wash-fastness; and pre-metallized or metal-complex dyes, valued for their superior lightfastness and durability in demanding applications such as automotive or upholstery textiles. The performance of these dyes is evaluated based on criteria such as color strength, leveling properties, exhaustion rates, and fastness characteristics including resistance to washing, light, rubbing, and perspiration, making them essential for achieving consistent, high-quality coloration in apparel, carpets, and luxury textiles while meeting stringent environmental and regulatory standards concerning heavy metal content, biodegradability, and wastewater impact.

The global Dyes For Protein Fibers market size was estimated at USD 5250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
