Abstracts

The dynamic erythrocyte sedimentation rate tester is an instrument used to measure the sedimentation rate and pressure volume of red blood cells in the blood. It is usually used to diagnose and monitor some inflammatory diseases, such as infections, autoimmune diseases, tumors, etc. The working principle of the dynamic erythrocyte sedimentation pressure and pressure tester is to use photoelectric sensors and microprocessors to continuously scan and analyze blood samples, and display the erythrocyte sedimentation rate curve and pressure volume curve, as well as the erythrocyte sedimentation rate and pressure volume value in real time. The advantages of the dynamic erythrocyte sedimentation rate tester are fast measurement speed, high accuracy, simple operation, and the ability to provide more information and parameters. The disadvantages of dynamic hematocrit testers are the high cost of equipment and the need for professional maintenance and calibration.

The global Dynamic Erythrocyte Sedimentation Rate Tester market size was estimated at USD 45.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
