Abstracts

Dynamic Ice Storage Systems are a form of thermal energy storage that produce and store ice during off-peak hours, typically at night when electricity demand and costs are lower, and then use the stored cooling capacity to provide air conditioning or process cooling during peak demand periods, thereby reducing energy consumption, lowering utility expenses, and enhancing grid stability. These systems consist of ice-making equipment, storage tanks, and heat exchangers that facilitate the transfer of cooling energy to the building's chilled water system, allowing for significant operational flexibility and contributing to sustainability goals by shifting electrical load and supporting the integration of intermittent renewable energy sources.

The global Dynamic Ice Storage Systems market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
