Report Overview

Volt-VAR Control or VVC refers to the process of managing voltage levels and reactive power (VAR) throughout the power distribution systems. These two quantities are related, because as reactive power flows over an inductive line (and all lines have some inductance) that line sees a voltage drop. VVC encompasses devices that purposely inject reactive power into the grid to alter the size of that voltage drop, in addition to equipment that more directly controls voltage.

The global Dynamic Volt Var Control Architecture market size was estimated at USD 185.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
