Abstracts

An e-bike mid-drive system is a type of electric bicycle propulsion mechanism where the motor is centrally located at the bike's crank or bottom bracket, directly driving the crankset and transmitting power through the bicycle's chain or belt drive to the rear wheel. This design allows the motor to leverage the bike's existing gears, resulting in more efficient power delivery across varying terrain, improved hill-climbing capability, and better weight distribution compared to hub-drive systems. Mid-drive systems are typically characterized by their integration with torque and cadence sensors, providing a more natural, responsive riding experience that closely mimics traditional cycling, and are commonly found in higher-performance e-bikes designed for off-road, touring, or urban commuting applications where efficiency and handling are prioritized.

The global E Bike Mid Drive System market size was estimated at USD 3800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
