Abstracts

Exonuclease I is a biological molecule with a specific enzymatic activity that can hydrolyze and remove nucleotides from the ends of DNA or RNA chains one by one. This enzyme plays an important role in molecular biology experiments and is often used to remove end damage from DNA or RNA fragments, prepare blunt-end DNA, and purify DNA before cloning or sequencing. The activity of Exonuclease I is highly specific, ensuring that the internal sequence of DNA or RNA is not damaged during the treatment process and that only the ends of the chain are operated on. In the laboratory, Exonuclease I is often used in fields such as DNA repair, genetic engineering, and genomics research, providing scientists with a precise and efficient tool to manipulate and analyze nucleic acid molecules.

The global Exonuclease I market size was estimated at USD 547.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
