Abstracts

The E. coli expression system is a genetic engineering system that uses E. coli as a host cell and efficiently expresses exogenous genes through the introduction of recombinant plasmid vectors. Leveraging the advantages of E. coli, such as its clear genetic background, rapid growth, low cultivation costs, and simple transformation procedures, combined with strong promoters to regulate the transcription and translation of target proteins, this system is widely used for recombinant protein production in scientific research, industry, and medicine. Although its lack of the post-translational modification capabilities of eukaryotic organisms limits the expression of certain complex proteins, the E. coli expression system remains one of the most commonly used and economical platforms for prokaryotic protein expression, thanks to its sophisticated vector design, optimized induction conditions, and high yields.

The global E. coli Expression System market size was estimated at USD 118.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
