### Report Overview

Earth observation is the process by which information related to Earth's physical, biological, and chemical composition are gathered from satellites by remote sensing techniques. The information gathered through satellites can be effectively used to monitor and predict weather changes, disasters and natural calamities, climate patterns, agriculture forecasts, oil and mineral deposits, and the availability of water sources. Satellite-based earth observation is used across various industries such as defense and intelligence, oil and gas, weather, agriculture, natural resources, engineering and construction, media and entertainment, and tourism.

Demand for earth observation market will be high from developing countries such as Vietnam, Malaysia, Kazakhstan and South Africa who would be widening their native autonomous capabilities in the near future. United States, Europe, China and India are all important operators of remote sensing satellites. Leading operators and service providers in these regions are partnering with Geographic Information System (GIS) companies and manufacturers of mobile devices to provide individual consumers with advanced information products and services. Initiatives taken by the government to embrace EO, in addition to the collaboration among operators to expand their capabilities by means of technology transfer would be the major driving factors in the satellite-based earth observation market.
