Abstracts

Eccentric Rotor Pumps also known as Progressing Cavity Pumps or Single Screw Pumps, are positive displacement pumps that use an eccentric rotor (or a rotor with an offset axis) to move fluid. These pumps consist of a rotor and a stator, where the rotor is mounted off-center within the stator. As the rotor turns, the space between the rotor and stator changes, creating cavities that trap and move the fluid. The eccentric motion of the rotor ensures a consistent and steady flow of liquid, making these pumps ideal for handling high-viscosity fluids or fluids with suspended solids. They are widely used in applications such as lubrication, chemical processing, and food and beverage industries. The Eccentric Rotor Pumps market can be segmented based on product types and applications.
