Abstracts

Echinocandins are a class of antifungal drugs that inhibit the synthesis of β -glucan in the fungal cell wall via noncompetitive inhibition of the enzyme 1,3- β glucan synthase. The class has been termed the "penicillin of antifungals," along with the related papulacandins, as their mechanism of action resembles that of penicillin in bacteria. Echinocandins are a class of antifungal medications administered through injection, widely used to treat severe fungal infections. These drugs target the β -1,3-glucan synthase enzyme in the fungal cell wall, leading to the inhibition of cell wall synthesis and subsequent fungal cell death. Common echinocandins include caspofungin, anidulafungin, and micafungin, often utilized in the treatment of refractory candidiasis such as invasive candidiasis. They typically require strict medical supervision and judicious use due to their lower toxicity targeting fungal cell wall synthesis, making them an important choice in combating fungal infections.

The global Echinocandins Antifungal Drugs market size was estimated at USD 1089.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
