Abstracts

Echo sounder transducers are electroacoustic devices that convert electrical energy into sound waves and vice versa, serving as the core component in marine echosounders and sonar systems by transmitting acoustic pulses into water and receiving their echoes to measure water depth, detect underwater objects, map seabed topography, and identify fish schools or submerged structures. These transducers operate across various frequencies tailored to specific applications?low frequencies for deep-water penetration and high frequencies for detailed resolution in shallow waters?and are designed to withstand harsh marine environments, with materials and construction optimized for durability, hydrostatic pressure resistance, and efficient acoustic performance in diverse salinity and temperature conditions.
