Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on ECMO Membrane Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. ECMO (Extracorporeal Membrane Oxygenation) membrane lung materials are hollow fiber membranes used to manufacture core components of ECMO devices. ECMO (extracorporeal membrane oxygenation) is a type of artificial life support that can help a person whose lungs and heart aren't functioning correctly. In 2024, the global production of ECMO membrane materials reached 243,200 square meters, with an average selling price of US\$588 per square meter. A typical single-line production capacity is approximately 100,000-200,000 square meters, and the industry's gross profit margin is approximately 25%-35%. Cost structure: Direct materials account for approximately 72%, manufacturing costs account for approximately 20%, and labor costs account for approximately 8%. Industry chain: Upstream consists of PP resin, PMP resin, and solvents/additives; downstream consists of oxygenator/ECMO system manufacturers. ECMO membrane materials have undergone years of development and now comprise three generations. The first generation of ECMO hollow fiber membranes used solid silicone membranes, offering good biocompatibility and minimal plasma leakage, but suffered from difficulties in venting, large pre-filling volumes, and significant transmembrane pressure differentials. The second generation used polypropylene (PP) microporous hollow fiber membranes, solving the venting problem, but still exhibiting plasma leakage. The third generation uses solid hollow fiber membranes, combining the advantages of the first and second generations while avoiding their drawbacks. It boasts high oxygen and nitrogen permeability and excellent overall performance, making it the most representative ECMO membrane material. Currently, the hollow fiber membrane market for ECMO is almost entirely monopolized by 3M in the United States. Due to

limited supply, ECMO membrane materials remain very expensive. 3M primarily supplies four types of ECMO membrane materials: Oxyphan capillary membranes, oxide membranes, Hexpet heat exchange capillary membranes, and Oxyplus capillary membranes. Oxyphan membranes are made of PP, while Oxyplus is made of PMP.

The global ECMO Membrane Material market size was estimated at USD 143.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
