Report Overview:

The application of ecological blankets is not only in the natural environment, but can also be used in cities. Laying ecological blankets in open spaces on slopes on both sides of urban roads not only protects the ecological environment, but also helps the air. Ecological blankets are used in a wide range of environments, which promotes the development of ecological blankets. When the multi-layer mesh structure of the plant fiber ecological blanket is laid on the urban road slope, it has a significant blocking, filtering and adsorbing effect on smoke and dust. The ecological blanket slope can be planted with grass, and the lawn can absorb a large amount of carbon dioxide, playing a role in the city. The coordinated and balanced function of carbon dioxide and oxygen in the area; the green plants planted have the effect of shielding, filtering and softening the sunlight, which can weaken and eliminate this stimulation, reduce the heat island effect, and reduce the indoor temperature; the edges of urban streets The slope is paved with plant fiber ecological blankets for greening, which improves the urban microclimate, purifies the air and beautifies the city. The ecological blanket slope protection technology combines the advantages of plant slope protection and reinforced mesh, and plays the role of a composite slope protection. The ecological blanket can play a very important role before the lawn becomes a lawn, and it can also increase the anti-scouring strength as the plants continue to grow. . 1. When the vegetation coverage rate of the slope is 0%, the ecological blanket will play the role of dispersing rainwater runoff; the ecological blanket is resistant to rainwater erosion, maintains water and soil, can naturally disperse the erosion of rainwater, and prevents rainwater from forming runoff, and relies on the ecological blanket Its own pulling force protects the slope and prevents it from collapsing. 2. When the vegetation coverage reaches less than 30%, it can withstand the erosion of light rain; the ecological blanket also has the function of

protecting the wall: the ecological blanket can prevent the evaporation of water on the soil surface. 3. When the vegetation coverage rate of the ecological blanket reaches more than 80%, it can withstand the erosion of heavy rain. And increasing the infiltration amount has a good effect. After the ecological blanket is formed into a flat, it relies on the root system of the grass to solidify the soil, and the ecological blanket will always protect the roots. 4. When the plants grow vigorously, the runoff flow rate that can resist erosion reaches 4m/s, and the ecological blanket is more than twice that of ordinary turf. The existence of the ecological blanket's reinforced mesh fixes the plant fibers evenly, which plays a role in reducing the evaporation of water in the slope soil and has a thermal insulation and moisturizing effect.
