Abstracts

Eco-friendly blowing agents are chemical substances used primarily in the production of polymer foams?such as polyurethane, polystyrene, and polyolefin foams?to create a cellular structure by generating gas during the manufacturing process. Unlike traditional blowing agents like hydrochlorofluorocarbons (HCFCs) or hydrofluorocarbons (HFCs), which have high global warming potential (GWP) and ozone depletion potential, eco-friendly alternatives include hydrocarbons (e.g., pentane, isopentane), hydrofluoroolefins (HFOs), water (which produces CO₂ via reaction), and inert gases like nitrogen or carbon dioxide. These agents are characterized by their low or zero GWP, minimal environmental impact, compliance with international regulations (such as the Kigali Amendment to the Montreal Protocol and regional directives like the EU F-Gas Regulation), and often improved energy efficiency in insulation applications. Their adoption is driven by the need to reduce greenhouse gas emissions while maintaining foam performance in terms of thermal insulation, density, and mechanical properties across industries such as construction, appliances, automotive, and packaging.

The global Eco Friendly Blowing Agents market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
