Report Overview

With the growing regulations and restrictions pertaining to energy conservation and reduction of fuel consumption, global economizers market is expected to create significant growth opportunities for industry incumbents during the forecast period. An economizer is a mechanical device which acts as a heat exchanger by preheating the feed water to improve the efficiency of the process. Economizers utilize residual heat from combustion products i.e. fuel gases, thereby improving thermal efficiency of the process as the process then requires relatively lesser fuel for the pre-heating the water in order to produce steam. Thus, economizers help in fuel saving and economizing the process and hence are referred to as economizers. Economizers offer numerous benefits, such as waste heat recovery and reduction of carbon emissions. These economizers also help in cooling gases in power plants prior to desulphurization. Thus, economizers help in cost reduction and water conservation. Improved and more efficient economizers are being developed to further improve the efficiency of the process.

The global Economizers market size was estimated at USD 9763.60 million in 2023 and is projected to reach USD 13556.23 million by 2030, exhibiting a CAGR of 4.80% during the forecast period.
