Abstracts

Eddy Current Testing (ECT) Solutions for Defect Detection refer to a class of non-destructive evaluation (NDE) techniques that utilize electromagnetic induction to detect surface and near-surface flaws in conductive materials. In this method, an alternating current is passed through a coil to create a changing magnetic field, which in turn induces circulating eddy currents within the test material. Variations in these eddy currents, caused by the presence of cracks, corrosion, or other material discontinuities, are detected and analyzed using sensors and advanced signal processing tools. ECT is particularly effective for identifying defects such as surface cracks, laps, or inclusions in metals without the need for direct contact or the use of coupling agents. These solutions are widely used in industries like aerospace, power generation, automotive, and manufacturing for inspecting components such as tubing, welds, and fasteners, offering high-speed, repeatable, and reliable inspection capabilities.

The global Eddy Current Testing Solutions for Defects Detection market size was estimated at USD 436.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
