Abstracts

Edge cloud service is a computing architecture that extends the resources and capabilities of cloud computing to the edge of the network, close to the data source or terminal device for data processing, storage and analysis. By deploying computing resources at the edge, edge cloud services can significantly reduce the latency of data transmission, improve real-time response capabilities, and reduce the burden on the central cloud. It is widely used in the fields of Internet of Things, smart cities, industrial automation, etc., and supports application scenarios with high timeliness requirements, such as real-time data processing, device control and augmented reality. Edge cloud services are rapidly becoming a core component of modern computing architecture, especially in application scenarios that require low latency and real-time data processing. With the surge in IoT devices and the explosive growth in data generation, edge cloud services provide a more efficient way to process data by bringing computing resources closer to the data source, reducing dependence on the central cloud. This not only improves the system's responsiveness, but also enhances data privacy and security. Edge cloud services have great potential for application, especially in areas such as industrial automation, smart cities, and telemedicine. However, enterprises need to balance factors such as data management, latency, and cost when deploying edge cloud services to achieve the best business value.

The global Edge Cloud Service market size was estimated at USD 2430.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.60% during the forecast period.
