Abstracts

Edge computing in retailing refers to the deployment of computing resources?such as servers, gateways, and IoT devices?closer to the physical locations where data is generated, such as stores, warehouses, or distribution centers, rather than relying solely on centralized cloud or data center infrastructure. This decentralized approach enables real-time or near-real-time data processing and analytics at the source, which is critical for applications like inventory management, personalized customer experiences, loss prevention, supply chain optimization, and operational efficiency. By minimizing latency, reducing bandwidth costs, and enhancing data privacy and security through localized processing, edge computing empowers retailers to act swiftly on insights, improve responsiveness to dynamic market conditions, and support advanced technologies like computer vision, AI-driven recommendations, and automated checkout systems without the delays associated with cloud round-trips.

The global Edge Computing In Retailing market size was estimated at USD 5200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
