Report Overview

Edge computing is a distributed computing paradigm that processes data closer to the source of data generation, rather than relying on centralized data centers or cloud-based infrastructure. This approach aims to reduce latency, minimize bandwidth consumption, and enhance the overall performance of applications by bringing computation and data storage closer to the end-users or IoT devices. Edge computing leverages edge devices, such as routers, switches, and IoT gateways, to perform data processing tasks, enabling real-time analytics and decision-making. It is particularly beneficial for applications requiring low-latency responses, such as autonomous vehicles, industrial automation, and augmented reality, where rapid data processing is crucial for optimal performance and safety.
