Abstracts

Edge computing is a distributed and open platform that integrates the core capabilities of network, computing, storage, and application closest to the source of things or data in the network, and provides edge intelligent services nearby. Providing services on the edge of the network closer to the terminal is the biggest feature of edge computing. For such a design, it can meet the key needs of various industries in terms of digital agile connection, real-time business, data optimization, application intelligence, security and privacy protection. Its advantages promote intelligence, connecting the two worlds of physical and digital in series. In edge computing, terminal devices can complete storage and computing tasks at edge nodes. This change will produce two major advantages. First, because computing tasks can be performed at the edge, external computing power can effectively extend the computing capabilities of terminal devices. Second, it saves bandwidth resources due to computing tasks transmitted in the network. The core facility layer, edge computing center, edge network, and edge equipment are the four-layer functional structure of the basic edge computing architecture. This architecture can realize the "cloud-side-end" synergy effect. At present, major global manufacturers include IBM, Microsoft, Amazon Web Services, Dell, Cisco, HPE, Huawei, Lenovo, etc., and the global major manufacturers account for more than 60% in 2020. From a regional perspective, the North American market is the largest in the global edge computing consumer market, accounting for about 37% of the market, followed by Europe, accounting for about 32%. The Asia-Pacific region also plays a large role in this global market. From the application point of view, edge computing is mainly divided into hardware and software services, of which software services account for a relatively large amount, about 57%. In addition, the product can be used in a variety of fields, such as transportation and logistics, manufacturing, and IT communications.

The global Edge Computing System market size was estimated at USD 12160.0 million

in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 21.00% during the forecast period.
