Abstracts

Edge detection devices are specialized hardware or integrated systems designed to identify and locate sharp discontinuities (edges) in digital images or video streams, which represent significant changes in pixel intensity often corresponding to object boundaries, surface markings, or other critical features in a scene; these devices leverage a combination of optical sensors, embedded processors, and algorithmic frameworks (such as Sobel, Canny, or Laplacian operators) to perform real-time or near-real-time edge extraction, and they are widely deployed across industrial automation (e.g., robotic guidance, quality inspection), autonomous vehicles (for lane and obstacle detection), security and surveillance systems, medical imaging (e.g., tumor boundary identification), and consumer electronics (like smartphone computational photography), with performance varying based on factors such as resolution, processing speed, accuracy, environmental adaptability, and integration capabilities with broader machine vision or AI pipelines.

The global Edge Detection Devices market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
