Report Overview

EDI (Electrodeionization) is a pure water manufacturing technology that combines ion exchange technology, ion exchange membrane technology and ion electromigration technology. It cleverly combines electrodialysis and ion exchange technology, uses high voltage at both ends of the electrodes to move charged ions in the water, and cooperates with ion exchange resin and selective resin membrane to accelerate the movement and removal of ions, thereby achieving the purpose of water purification. During the EDI desalination process, ions are removed through the ion exchange membrane under the action of an electric field. At the same time, water molecules produce hydrogen ions and hydroxide ions under the action of an electric field, and these ions continuously regenerate the ion exchange resin to keep the ion exchange resin in optimal condition.
