Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on EDTA-4Na (Ethylenediaminetetraacetic Acid Tetrasodium Salt) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. EDTA-4Na (Ethylenediaminetetraacetic Acid Tetrasodium Salt) usually refers to the tetrasodium salt of ethylenediaminetetraacetic acid. It is an inorganic organic composite salt obtained by neutralizing the carboxylic acid group with four sodium ions on the ethylenediaminetetraacetic acid molecule. It is generally a white solid and is easily soluble in water. The aqueous solution is highly alkaline and has strong metal chelating ability and can interact with calcium, magnesium, iron, copper, etc. A variety of metal ions form stable and soluble complexes, so it is widely used as a general chelating agent and formula stabilizer in the fields of water treatment, industrial cleaning, papermaking, textile printing and dyeing, detergents, cosmetics and agricultural trace element fertilizers. It is one of the most widely used and widely used salt varieties in the EDTA family. In 2024, global EDTA-4Na (Ethylenediaminetetraacetic Acid Tetrasodium Salt) production will reach 32.94 K MT, with an average selling price of US\$16,362/ton. In the downstream structure, water treatment and industrial cleaning, daily chemical detergents, and papermaking and textiles are still the core application scenarios. The driving force comes from the tightening of industrial and urban sewage discharge standards, the increasing demand for washing in hard water areas, and the increasing requirements for stable performance in pulp bleaching, fiber dyeing and finishing. At the same time, in order to improve formula stability and enhance the reliability of anti-corrosion systems in cosmetics and personal care products, the usage of tetrasodium EDTA has also continued to grow. Regionally, Asia-Pacific, especially China, is the focus of production

and sales. On the one hand, it relies on complete upstream supporting facilities such as ethylenediamine and chloroacetic acid, which has cost and scale advantages. On the other hand, the demand for chelated fertilizers for water treatment, textile, papermaking, daily chemicals and agriculture in the region is rapidly expanding, making the Asia-Pacific market continue to increase its share of global EDTA tetrasodium. In terms of environmental protection and supervision, some developed regions are concerned about the environmental durability of EDTA and promote the replacement of new biodegradable chelating agents in some scenarios. However, in industrial applications with high alkalinity, high temperature, and strong chelation requirements, EDTA tetrasodium will remain the main player in the short term due to its maturity, reliability, and high cost performance. The overall trend is more reflected in the optimization of dosage in the formula and differentiated substitution by industry, rather than simple overall significant compression.

The global EDTA-4Na (Ethylenediaminetetraacetic Acid Tetrasodium Salt) market size was estimated at USD 539.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
