Abstracts

EDTA (Ethylenediaminetetraacetic acid) vacuum blood collection tubes are specialized tubes used in phlebotomy (blood collection) to obtain blood samples for various laboratory tests. EDTA is an anticoagulant that prevents blood from clotting by chelating (binding) calcium ions, which are essential for the coagulation process. These tubes are commonly used for hematological studies and are especially suitable for complete blood count (CBC) testing. The EDTA (Ethylenediaminetetraacetic Acid) Vacuum Blood Collection Tubes market is driven by the critical role these tubes play in preserving blood samples for various laboratory tests.
