Emission gas recirculation (EGR) and nitrogen oxides (NOx) measurement refers to the process of monitoring and quantifying the recirculation of exhaust gases and the concentration of nitrogen oxides in emissions, primarily within automotive, industrial, and power generation sectors to comply with environmental regulations and optimize combustion efficiency. This involves the use of specialized sensors, analyzers, and systems designed to detect, record, and sometimes control the levels of NOx—a harmful pollutant—and the rate of EGR, which is a technique used to reduce NOx formation by lowering combustion temperatures through reintroducing a portion of exhaust gas into the engine's intake air.

The global Egr And Nox Measurement market size was estimated at USD 85.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
