### Report Overview

The EGR is an exhaust gas recirculation device used for the purpose of lowering emissions.

The purpose of the EGR is to allow a certain amount of exhaust to return and be mixed with the incoming fuel into the cylinders at cruising speed. This helps to cool the cylinders, allowing for a higher degree of ignition advance to burn more of the fuel. This makes the engine more efficient. If the EGR is not used, the ignition timing would have to be retarded somewhat so that detonation would not occur.
