Abstracts

EHV (Extra High Voltage) and UHV (Ultra High Voltage) transformers are types of transformers used in electrical power systems for the transmission of electrical power at very high voltages. They play a crucial role in the efficient transfer of electricity over long distances, minimizing power losses. Typically, EHV transformers are designed to handle voltages between 220 kV to 765 kV. UHV transformers are designed for even higher voltage levels, generally above 800 kV, with some systems operating at voltages up to 1,200 kV or more. Compared with traditional 35kV transformers, 66kV liquid-immersed transformers can extend the transmission distance, improve energy transmission efficiency and system reliability, while reducing cable length, transmission loss and fault maintenance risks. A single large-capacity wind turbine matched with a 66kV large-capacity wind power transformer can reduce the number of wind turbines required for the overall project, reduce construction and operating costs, and help improve the profitability and sustainable development of wind power projects.

The global EHV and UHV Transformers market size was estimated at USD 557.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
