Report Overview

Elapegademase Ivlr is a recombinant adenosine deaminase (ADA) enzyme replacement therapy used to treat severe combined immunodeficiency (SCID) caused by ADA deficiency, a rare genetic disorder that impairs immune system function. The drug, marketed under the name Revcovi, works by replacing the deficient enzyme, thereby restoring immune function and reducing the risk of life-threatening infections. It is administered via intramuscular injection and is approved for both pediatric and adult patients. The market for Elapegademase Ivlr is highly specialized, targeting an extremely small patient population due to the rarity of ADA-SCID, which affects approximately 1 in 200,000 to 1,000,000 live births globally. Given the critical nature of the condition and the lack of alternative treatments beyond stem cell transplantation, the drug commands a premium price, positioning it within the ultra-orphan drug category. The competitive landscape is limited, with few direct competitors, though gene therapies such as Strimvelis (ex-vivo gene therapy) represent emerging alternatives. Market growth is driven by increased newborn screening programs, improved diagnosis rates, and advancements in rare disease therapeutics, though high treatment costs and reimbursement challenges in certain regions may limit accessibility. The U.S. and Europe remain key markets due to robust healthcare infrastructure and favorable orphan drug policies.

The global Elapegademase Ivlr market size was estimated at USD 15.61 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.64% during the forecast period.
