## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Aircraft Refueller competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Electric Aircraft Refueller production reached approximately 1,202 units, with an average global market price of around 146 K USD per unit. An Electric Aircraft Refueller is a ground support vehicle equipped with an electric powertrain that supplies aviation fuel or electric charging services to aircraft in airports, replacing traditional diesel-powered refuellers. It integrates electric drive systems, high-capacity batteries, fuel pumping or charging modules, and digital control systems to ensure efficient, clean, and safe refueling or energy delivery operations. These refuellers are used to support both conventional and electric aircraft, aligning with the aviation industry's decarbonization and green airport initiatives. The industry chain of Electric Aircraft Refueller includes three main segments: upstream, midstream, and downstream. Upstream mainly involves suppliers of electric powertrain components (such as motors, batteries, and controllers), hydraulic systems, fuel tanks, and electronic control modules. Midstream focuses on refueller manufacturers that integrate these components into complete vehicles, conduct system testing, and ensure compliance with airport safety and environmental standards. Downstream encompasses airport operators, ground handling companies, and airlines that deploy these refuellers for daily aircraft servicing. The industry is supported by government incentives, airport electrification programs, and sustainability mandates promoting the replacement of fossil-fuel-powered refuellers. The cost structure of Electric Aircraft Refueller is typically composed of raw materials (around 50-55%), manufacturing and assembly (20-25%), R&D and design (10-15%), labor and logistics (5-8%), and marketing, certification, and administrative expenses (5-7%). Among these, high-voltage batteries, electric motors,

and control electronics represent the most significant portion of material costs, followed by chassis and fuel or charging system components. The relatively high upfront cost is offset over time by reduced fuel, maintenance, and emissions-related expenses, contributing to a lower total cost of ownership compared with conventional diesel models. The single-line production capacity of Electric Aircraft Refueller is 112 to 115 units per year, the average gross profit margin was 26.7%.

The global Electric Aircraft Refueller market size was estimated at USD 176.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
