Report Overview

Electric Angle seat valves are valves where a spindle under an angle moves the seal in a linear motion towards or away from the valve seat. This seal is usually PTFE (teflon) and the valve housing is usually brass or stainless steel. Due to the Y-shape the medium can flow through relatively easily (few bends). As a result, these valves have a high flow capacity and Kv value in comparison with vertical globe valves. Angle seat valves are reliable, require low maintenance and are characterized by a long lifespan with millions of cycles. They are used with gases, vacuum or (viscous) liquids and seal in two directions. Other names for these valves are valve shut-off valves, Y-valves or globe valves. The valves can be manually operated by means of a screw spindle, or air operated by a piston that moves in an air cylinder. The valve generally closes in the same direction as the flow direction. There are special versions where the valve closes against the flow direction, in order to reduce the risk of water hammer.
