Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Boats competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electric boats, also known as e-boats, are watercraft propelled by electric motors powered by batteries or fuel cells instead of conventional internal combustion engines. This shift is driven by growing environmental regulations targeting marine emissions, rising fuel costs, and consumer demand for quieter, low-maintenance vessels. Advances in battery technology, charging infrastructure, and lightweight materials have further enabled electric propulsion systems to match or exceed the performance of diesel or gasoline engines for many applications, particularly in recreational and inland-water markets. Regionally, Europe currently leads in both market share and infrastructure readiness, driven by stringent emission regulations and strong marine leisure sectors. North America is the fastest-growing market, benefiting from significant investments in electric charging networks and incentive programs, while the Asia-Pacific region, especially China, is rapidly emerging due to its expansive manufacturing base and growing domestic demand for emission-free marine transport. Challenges persist in battery range (50-100 miles/charge) and charging infrastructure, while innovations from players like X Shore and CATL aim to lower costs and boost performance.

The global Electric Boats market size was estimated at USD 3185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.60% during the forecast period.
