Abstracts

The electric van runs on electric energy powered by the motor; the vehicle does not emit exhaust gas. The e-van consists of a large lithium-ion battery pack and a high-capacity motor for driving. The output from the lithium-ion battery is DC, but the drive motor of electric vehicles is an AC motor. Therefore, an inverter that converts the DC into three-phase AC must also be installed. Some electric vans have petrol engines and are referred to as hybrid vehicles. In a hybrid vehicle, the engine can be used to drive the vehicle when the battery charge is depleted, or the battery can be saved for town and city driving.

The global Electric Cargo Van market size was estimated at USD 309.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 29.10% during the forecast period.
