Report Overview

The Electric-discharge Lamps are one of the reliable sources of artificial light energy, which fundamentally works by converting electrical energy to light energy by ionizing the gas particles. Discharge lamp gained popularity, in the mid-twentieth century. The best part of the discharge lamps, it can produce lights of different colors. Due to its working principle, it is cheap, long-lasting, and can be used for a number of applications.

The discharge lamps work on the fundamental principle that, light is emitted when the electrons have collided with each other. To obtain this, the first gas an ionized at very high voltage. At low pressure, gas maintained in a glass tube. At the end of the tube, two electrodes are placed which are excited with an alternating voltage source.

When the source produces high voltage, then the gas inside the glass tube gets ionized due to the ionization of the molecules. The ionized electrons tend to move from one end to the other end. In this process, the ionized electrons collide with the unionized electrons and emit light. Based on the properties of the gas different colors of light can be produced.
