## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Flame Stove competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of electric flame stoves will reach 1.31 million units, with an average selling price of US\$500 per unit. An electric flame cooker is a kitchen appliance that uses electricity as its primary energy source, generating flame effects or high-temperature heat through electric heating elements or electromagnetic induction technology. It combines energy conservation and environmental protection with uniform heating and precise temperature control. Some models also utilize simulated flame technology to achieve a visual effect similar to that of an open flame on a gas stove, meeting the demands of modern kitchen cooking while also enhancing safety and aesthetics. The upstream supply chain for electric flame stoves primarily involves the supply of core components and raw materials, including heating elements such as electromagnetic coils, electric heating tubes, and heating films; flame simulation components such as LED lamp beads and atomizers; structural materials such as tempered glass, stainless steel, and aluminum; as well as intelligent control chips, sensors, and power modules. These upstream links determine the heating efficiency, flame quality, and intelligence level of electric flame stoves, and are also key sources of product cost and technological differentiation.

The global Electric Flame Stove market size was estimated at USD 655.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
