Report Overview

Electric fusion is the most commonly used melting process for manufacturing quartz glass. This process uses resistance Heaters to melt natural quartz sand into quartz glass tubes, rods, blocks etc.. There are two methods of electric fusion, continuous fusion and batch fusion. In the continuous process, quartz sand is continuously poured into the upper part of a tungsten crucible surrounded by electric heating elements. The inside crucible is maintained in a neutral or slightly reduced atmosphere that keeps silica from reacting with the refractory metal while the silica is melted inside. The melted quartz exits at the forming part at the bottom of crucible which is shaped into tube, rod and so on. The OH can be reduced by annealing. In the batch fusion process, several tons of raw material are placed inside a refractory vacuum chamber containing graphite heating elements to produce tubes, rods and so on. The OH is usually below 2ppm. The low OH makes electrically fused quartz glass has a high infrared transmission. The electrically fused quartz glass usually has certain bubbles and drawing lines on the glass surface.
