Abstracts

An electric heating element converts electricity into heat through the process of resistive or Joule heating. Electric current passing through the element encounters resistance, resulting in heating of the element. Unlike the Peltier effect, this process is independent of the direction of current flow. A typical Electric heating element is usually a coil, ribbon (straight or corrugated), or strip of wire that gives off heat much like a lamp filament. When an electric current flows through it, it glows red hot and converts the electrical energy passing through it into heat, which it radiates out in all directions.

The global Electric Heating Elements market size was estimated at USD 10010.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.05% during the forecast period.
