Abstracts

Electric tracing is an effective solution for pipe insulation and antifreeze. It is also a technology that uses electric heat energy to supplement the heat lost by the heated body in the process flow, thereby maintaining the most reasonable process temperature of the flowing medium. It releases heat evenly along the length of the pipeline or over a large area of the tank volume, which is different from the heating method in which the heat load is highly concentrated at one point or a small area. Electric tracing has a small temperature gradient and a long thermal stability time, which is suitable for long-term use. The heat (electric power) required is much lower than that of electric heating.

The global Electric Heating Products market size was estimated at USD 3459.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
