Abstracts

Electric locomotive engines are electric traction systems that convert electrical energy from overhead lines, third rails, or onboard energy storage into mechanical energy to propel trains, featuring key components such as traction motors, power converters, transformers, and control systems designed for high torque, energy efficiency, and reliability in freight and passenger rail operations. These engines are distinguished by their use of externally supplied electricity rather than onboard fuel combustion, enabling lower emissions, reduced operational noise, and higher power output compared to diesel alternatives, making them essential for electrified rail networks in urban, suburban, and long-distance transportation contexts where infrastructure supports continuous or intermittent power supply.

The global Electric Locomotive Engines market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
