Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Motorcycle competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electric motorcycles (including electric mopeds) are throttle-controlled, battery-electric two-wheeled motor vehicles propelled solely by an onboard rechargeable powertrain. In the current market, global production is around 15.3 million units, with an average selling price of about USD 325 per unit on an EXW basis, implying a hardware market value of roughly USD 5.25 billion (your baseline). The product landscape is best organized along practical axes used by OEMs and channels: vehicle form (moped/step-through vs. straddle-type motorcycle), battery system (fixed wired packs, removable plug-in packs, and networked swapping), battery cell chemistry (with lead-acid still prominent in China's sales mix alongside LFP/NMC and emerging sodium-ion), and nominal power bands (3 kW, 3-7 kW, 7-11 kW, >11 kW). Upstream and downstream dynamics follow from these axes. Cell chemistry drives cost and performance trade-offs: lead-acid remains entrenched in price-sensitive commuter segments, while LFP/NMC dominate removable/swappable and higher-spec products; sodium-ion is emerging from pilots in select use cases.

The global Electric Motorcycle market size was estimated at USD 4960.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Electric Motorcycle market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights. It examines market size, competitive landscape, emerging
