Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Park Brake (EPB) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electronic park brake is a kind of technology which realizes vehicle parking brake by electronic control. Its core function is to replace the traditional mechanical hand brake, integrate the temporary braking and parking braking functions, and apply braking force through electronic signal control actuators such as motors or calipers. Market Concentration and Key Players: Internationally, the market concentration of electronic parking brakes is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as ZFHELLA and Continental; from the domestic point of view, electronic parking brakes still have a lot of room for development in China. Manufacturing Process and Market Trends: The manufacture technology of electronic parking brake is based on high-precision electromechanical integration technology. Its actuator mainly adopts thread drive or ball screw drive system, which converts motor torque into linear thrust of brake piston through deceleration mechanism, and realizes static parking depending on self-locking characteristics of thread pair. In terms of material technology, there is a significant trend towards lightweight, such as ZF's integrated motor-caliper design to reduce weight, while integrating high temperature resistant alloys and carbon fiber composites to improve reliability. The manufacturing process involves precision machining, sensor calibration and redundant control system development, such as Bethel's brake-by-wire system, which uses dual proportional solenoid valves to achieve power-off redundancy protection and 3D printed valve block optimization structure. On the market trend, the growth rate of China market is higher, mainly benefiting from the improvement of penetration rate of new energy vehicles and the promotion of intelligent

driving policy. Technology evolution shows intelligence and functional integration: EPB is deeply integrated with autonomous driving systems, such as automatic parking, ramp assistance and NOA functions, and some manufacturers such as Continental have realized hardware integration with electronic stability control. In addition, environmental regulations drive lightweight innovations, such as replacing traditional resistance wires with graphene heating films to reduce energy consumption by 30%, while adapting degradable sealing materials to reduce environmental impact. In the competitive pattern, international giants still dominate the market, but China's local enterprises make technological breakthroughs and accelerate their layout in frontier fields such as redundant braking and EMB.

The global Electric Park Brake (EPB) market size was estimated at USD 6310.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
