Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Podded Propulsor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electric Podded Propulsor is an advanced marine propulsion system where the electric motor is housed within a streamlined pod located outside the hull, directly driving a fixed or azimuthing propeller. This configuration eliminates the need for traditional shaft lines and rudders, enabling more flexible vessel design, reduced noise and vibration, and improved hydrodynamic efficiency. Podded propulsors are driven by electric power, which may come from diesel-electric generators, gas turbines, batteries, or hybrid systems. These systems also facilitate greater design freedom for shipbuilders by eliminating long shaftlines and allowing aft placement of propulsion units.

The global Electric Podded Propulsor market size was estimated at USD 2636.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
