Abstracts

The electric power steering (EPS) torque sensor is a device used to measure the steering torque of a vehicle. It is an important component of the EPS system, used to monitor the torque applied by the driver to the steering wheel and transmit these signals to the EPS control unit. EPS torque sensors usually use technologies such as piezoelectric sensors or strain gauges to measure torque. When the driver applies torque, the sensor generates a corresponding electrical signal and converts it into a digital signal so that the EPS control unit can process and respond. The role of the EPS torque sensor is to provide accurate steering torque information so that the EPS system can provide appropriate assistance according to the driver's intention. By monitoring the steering torque, the EPS system can adjust the steering assistance in real time to meet the needs of different driving conditions, such as low-speed cornering and high-speed driving. As the EV market expands globally, EPS systems will become a standard feature in many vehicles. With the absence of traditional powertrains in EVs, EPS systems will be crucial for improving vehicle maneuverability and comfort. The development of wireless and digitally controlled EPS systems will allow for further innovation in vehicle designs and offer new growth opportunities for sensor suppliers. Steer-by-wire technology, which eliminates the traditional mechanical link between the steering wheel and the front axle, is gaining traction in the automotive industry. This technology allows for more flexible and innovative vehicle designs, including more spacious interiors and customizable steering feedback. As this technology enters mass production, EPS sensors will become even more critical for ensuring the safety and performance of these systems. The integration of sensors within steer-by-wire systems will also drive new opportunities for sensor manufacturers. The advancement of sensor technology, such as the development of sensors with higher precision, reliability, and longer lifespans, will continue to drive innovation in the EPS sensor market. Additionally, the increasing integration of artificial intelligence (AI) and machine learning (ML)

algorithms in steering systems will enhance the performance of EPS sensors. These sensors will be able to dynamically adjust steering feel and responsiveness based on real-time data, leading to more intuitive and safer driving experiences.

The global Electric Power Steering (EPS) Sensor market size was estimated at USD 945.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
