## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Propulsion Pod Drive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electric Propulsion Pod Drive is a marine propulsion system in which an electric motor is housed within a steerable pod located outside the ship's hull, directly driving a propeller without the need for traditional shafts or rudders. This configuration allows for full 360-degree maneuverability, greater propulsion efficiency, and reduced vibration and noise compared to conventional mechanical systems. The electric motor receives power from onboard generators, batteries, or hybrid energy sources, converting electrical energy into thrust with high precision and responsiveness. Electric propulsion pod drives are widely used in cruise ships, ferries, offshore vessels, and naval ships, supporting enhanced fuel efficiency, environmental performance, and vessel handling in both commercial and advanced marine applications. The unit price of Electric Propulsion Pod Drive varies greatly depending on the power. Usually, the low-power version is between US\$1,500 and US\$3,000, while the higher-power version is more expensive. The gross profit margin is usually between 25% and 35%. The upstream and downstream supply chain for electric propulsion pod drives involves a network of specialized components, technologies, and end-user industries. Upstream, the supply chain includes the sourcing of key raw materials such as marine-grade steel, aluminum alloys, permanent magnets, copper windings, and composite materials, along with the production of electric motors, propellers, bearings, and control electronics. Further downstream, service providers handle maintenance, retrofitting, performance monitoring, and lifecycle support to ensure operational reliability and compliance with evolving environmental standards in marine transportation.

The global Electric Propulsion Pod Drive market size was estimated at USD 109.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
