Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electric Resistance Heating Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electric Resistance Heating Systems are devices or assemblies that convert electrical energy directly into heat through the resistance of a conductive material (typically a metal such as nichrome or copper). When an electric current flows through a resistive element, it encounters resistance, causing electrical energy to be dissipated as thermal energy. These systems are commonly used for space heating, industrial processing, and appliances such as ovens, toasters, and water heaters. They can take various forms, including strip heaters, tubular heaters, and coil heaters, and offer advantages such as precise temperature control, high efficiency at the point of use, and minimal moving parts. However, they are often less energy-efficient overall when compared to other systems like heat pumps, particularly where electricity is generated from fossil fuels.

The global Electric Resistance Heating Systems market size was estimated at USD 12495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
