Abstracts

An electric stepper motor is a brushless DC electric motor that divides a full rotation into a number of equal steps, allowing for precise control of angular position without the need for a feedback sensor, as its motion is synchronized to digital pulses supplied by a controller; it operates on the principle of electromagnetism, where the stator's windings are energized in a specific sequence to create magnetic fields that attract the rotor's teeth, causing it to move in discrete increments, making it ideal for applications requiring accurate positioning, speed control, and repeatability, such as in CNC machines, 3D printers, robotics, and automated manufacturing systems.

The global Electric Stepper Motor market size was estimated at USD 1045.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.65% during the forecast period.
